INTRODUCTION

The forty-eighth annual report, Part II of the Public Health Statistics Section presents tabular information regarding North Carolina's population, births, deaths, fetal deaths, marriages, and divorces. Part I of the annual report, which is printed separately, includes data on the communicable diseases which are reportable to the State Board of Health.

The data on births, deaths, and fetal deaths are shown by place of residence except when otherwise indicated. All tables on marriages and divorces are by place of occurrence.

This report includes all vital events occurring in 1963 that were filed in 1963 and the first three months of 1964. It is estimated that less than one per cent of the 1963 events will be reported too late for inclusion in this report.

POPULATION

The population data in this report are estimated as of July 1, 1963 by the arithmetic, or straight-line method. This method assumes that each county had the same actual annual increase or decrease between 1962 and 1963 that it had on the average each year between 1950 and 1960.

NATALITY

In 1963 there were 107,322 live births occurring to mothers who were residents of North Carolina. This represents a decrease of 2,227 or 2.0 per cent from the total resident births recorded for 1962. The crude birth rate was 22.8 per 1,000 population. Figure 1 shows the crude birth rates from 1914-1963. Over the past sixteen years there has been a slightly irregular downward trend in the birth rate.

FIGURE 1.
LIVE BIRTH RATES
NORTH CAROLINA, 1914 - 1963

There were 73,449 white births and 33,873 nonwhite births in 1963. Approximately 99.6 per cent of the white births and 80.1 per cent of the nonwhite births occurred in hospitals.

PREMATURE BIRTHS

A premature infant is defined as an infant weighing 2500 grams (5½ pounds) or less at birth regardless of the period of gestation. This definition, which is the one used by the American Academy of Pediatrics, has been adopted in order to achieve uniformity in the classification of premature infants needing special care, and comparability of statistical data among hospitals.

In 1963 there were 10,175 resident premature live births reported among 107,322 live births. Birth weight was reported on all but 60 certificates filed in 1963. Consequently, at least 9.5 per cent of the newborn babies weighed 2500 grams or less at birth. The number of premature infants by birth weight and color and by age of mother and birth weight are shown in the tables which follow:

FETAL DEATHS

This state defines a fetal death as a fetus showing no evidence of life after complete birth when the twentieth week of gestation has been reached. There were 1,928 resident fetal deaths reported, resulting in a ratio of 18.0 fetal deaths per 1,000 live births. If fetal deaths were considered as a single cause of death, they would rank fifth between influenza and pneumonia, and motor vehicle accidents as a leading cause of death.

MORTALITY

A total of 40,529 North Carolina residents died in 1963. The crude death rate was 8.6 per 1,000 population. Figure 2 illustrates the crude death rates for 1914 through 1963. Since reaching a low point of 7.4 in 1954, there has been a gradual increase in the crude death rate, which is probably due to changes in our population structure.

FIGURE 2.
DEATH RATES
NORTH CAROLINA, 1914 - 1963

All mortality statistics shown by cause of death in this report are classified according to the Seventh Decennial Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death. In Table 12, which shows deaths from selected causes with rates, 1923-63, it is necessary to take into consideration prior revisions of the International Classification in making comparisons of selected causes of death since 1949 with prior years. Comparability ratios for specific causes of death may be obtained upon request.

Table 13 shows the leading causes of death for all ages and for specific age groups. Five-year averages are used in ranking these causes. Heart disease has been the leading cause of death consistently since 1930. The total deaths from this cause in 1963 were 14,478 which represents an increase of 3.1 per cent over 1962.

INFANT AND MATERNAL MORTALITY

There were 3,342 infant deaths and 59 maternal deaths reported. The resultant infant death rate per 1,000 live births was 31.1 while the maternal death rate was 5.5 per 10,000 live births.

In 1918 there was an all-time high rate of 101.8 infant deaths per 1,000 live births. The infant mortality rate was more than three times as high at that time as it was in 1963 while the maternal rate was nearly 19 times higher in 1918.

HOSPITAL DATA

All tables in this report which reflect events occurring in hospitals are based on the general and allied hospital definition of the North Carolina Medical Care Commission. A hospital is defined as a place where two or more non-related individuals reside 24 hours or more on the premises and receive medical care over and above any domiciliary care.

RATES

All birth and death rates shown in this report are crude rates unless otherwise specified. These rates are computed by dividing the number of events by the estimated midyear population and multiplying the quotient by 1,000. Such rates have not been adjusted for differences in the age, sex, race, rural or urban distribution of the population, or for underregistration or late reporting. Such factors should be kept in mind when comparing two different areas or time periods.

MARRIAGES AND DIVORCES

The central registration of marriages became effective in this state in 1962. As of January 1964, North Carolina was admitted to the National Marriage Registration Area. A total of 35,450 marriages were recorded for 1963.

There were 7,319 divorces and annulments recorded for 1963, which was an increase of 6.4 per cent over the previous year. A total of 6,974 divorces were granted on the grounds of two-years separation, with 229 or 3.1 per cent being granted on the grounds of adultery. Divorce statistics may be obtained as far back as January 1958.
